

# Objectives & Analysis

## Objective 1: Average Calories Burned by Workout Type

This analysis calculates the average calories burned for each workout type and ranks them in descending order.

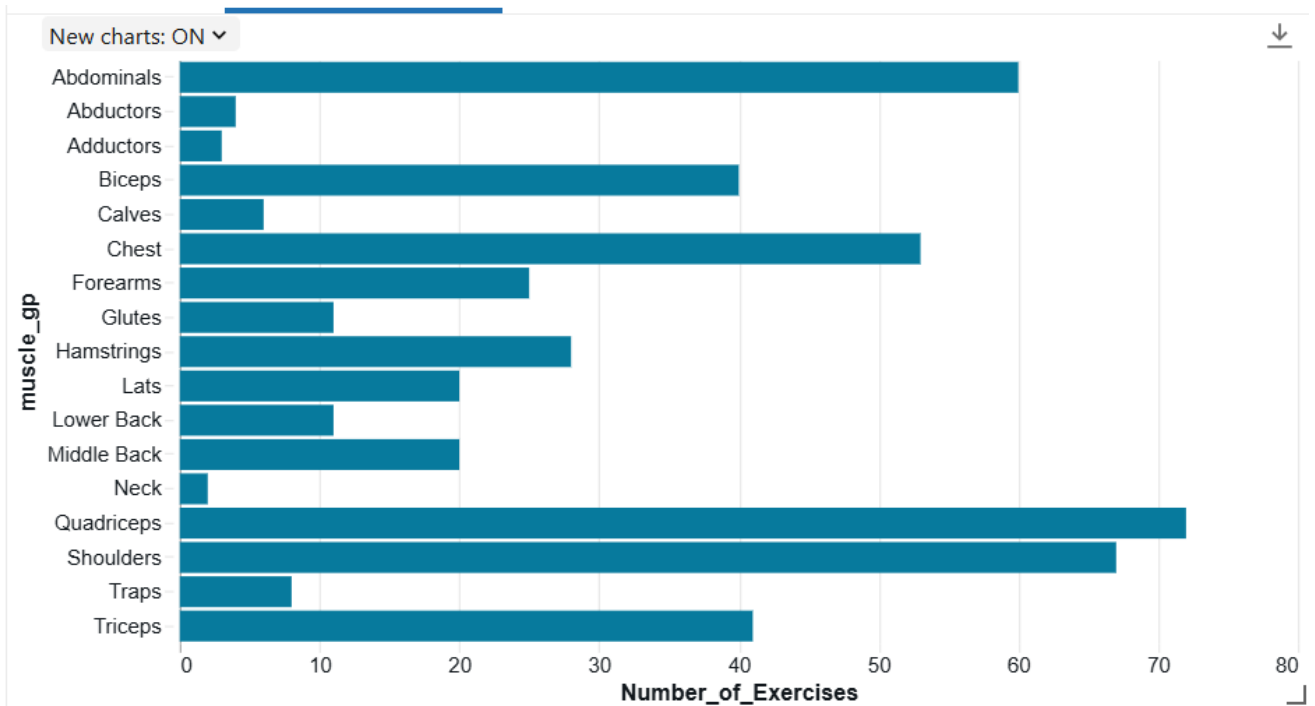

### PySpark Code

```
from pyspark.sql import functions as F
obj1 = df2.groupBy("Workout_Type")
        .agg(F.avg("Calories_Burned").alias("Avg_Calories"))
        .orderBy("Avg_Calories", ascending=False)
display(obj1)
```

## Objective 2: Number of Exercises per Muscle Group

This analysis counts the number of exercises available for each muscle group and ranks them from highest to lowest.

### PySpark Code

```
obj2 = df1.groupBy("muscle_gp")\
    .count()\
    .withColumnRenamed("count", "Number_of_Exercises")\
    .orderBy("Number_of_Exercises", ascending=False)\
    display(obj2)
```
